

PROJECT 1: METRIC MIND

BACKEND DEVELOPMENT

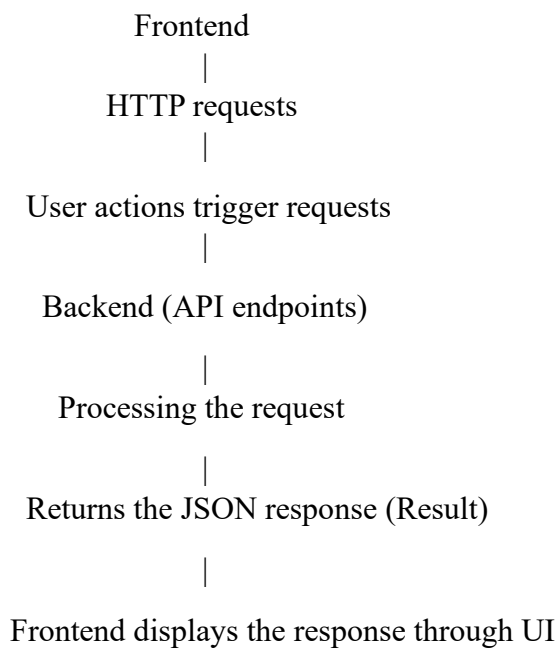

1. How FastAPI Works?

- It's a python framework which is used to build web API's and make them work efficiently.
- Role is to receive requests and give response to the requests.
- Uses Swager UI at /docs to make the project more interactive.

2. Rest APIs GET and POST

- These APIs communicates over HTTP
- GET: a type of request to fetch the data from the server.
- POST: a type of request to send the data to the server to process it.
- Endpoints : `@app.get()` and `@app.post()`
- Exchanges data in JSON format.

3. How frontend communicates with Backend?

4. How FastAPI is used in MetricMind?

- FastAPI serves as a backend in the project
- Receives user questions from Next.js chat Interface
- Passes queries to Agentic AI layer
- AI agent then communicates with the Semantic Layer to retrieve governed business metrics and it later returns results for frontend for visualization.
